1 Problems From Tie

1.1 1

Prove that if f has two Laurent series expansions,

$$f(z) = \sum c_n(z - a)^n \quad \text{and} \quad f(z) = \sum c_n'(z - a)^n$$

then $c_n = c_n'$.

1.1.1 Solution

By taking the difference of two such expansions, it suffices to show that if f is identically zero and $f(z) = \sum_{n=-\infty}^{\infty} c_n(z - a)^n$ about some point a, then $c_n = 0$ for all n.

Under this assumption, let $D_\varepsilon(a)$ be a disc about a and γ be any contoured contained in its interior. Then for each n, we can apply the formula

$$
\begin{aligned}
c_n &= \frac{1}{2\pi i} \int_\gamma \frac{f(\xi)}{(\xi - a)^{n+1}} \, d\xi \\
&= \frac{1}{2\pi i} \int_\gamma \frac{0}{(\xi - a)^{n+1}} \, d\xi \quad \text{by assumption} \\
&= 0,
\end{aligned}
$$

which shows that $c_n = 0$ for all n.

■

1.2 2

> Find Laurent series expansions of
>
> $$\frac{1}{1-z^2} + \frac{1}{3-z}$$
>
> How many such expansions are there? In what domains are each valid?

1.2.1 Solution

Note that f has poles at $z = -1, 1, 3$, all with multiplicity 1, and so there are 3 regions to consider:

1. $|z| < 1$
2. $1 < |z| < 3$
3. $3 < |z|$.

Region 1: Take the following expansion:

$$f(z) = \frac{1}{1-z^2} + \frac{1}{3-z}$$

$$= \sum_{n \geq 0} z^{2n} + \frac{1}{3}\left(\frac{1}{1 - \frac{3}{z}}\right)$$

$$= \sum_{n \geq 0} z^{2n} + \frac{1}{3} \sum_{n \geq 0} \left(\frac{1}{3}\right)^n z^n$$

$$= \sum_{n \geq 0} z^{2n} + \sum_{n \geq 0} \left(\frac{1}{3}\right)^{n+1} z^n$$

.

Noting $\left|z^2\right| < 1$ implies then $|z| < 1$, and that the first term converges for $\left|z^2\right| < 1$ and the second for $\left|\frac{z}{3}\right| < 1 \iff |z| < 3$, this expansion converges to f on the region $|z| < 1$.

Region 2: Take the following expansion:

$$f(z) = \frac{1}{1 - z^2} + \frac{1}{3 - z}$$

$$= -\frac{1}{z^2}\left(\frac{1}{1 - \frac{1}{z^2}}\right) - \frac{1}{3}\left(\frac{1}{1 - \frac{z}{3}}\right)$$

$$= -\frac{1}{z^2}\sum_{n \geq 0} z^{-2n} + \sum_{n \geq 0}\left(\frac{1}{3}\right)^{n+1} z^n$$

$$= -\sum_{n \geq 2}\frac{1}{z^{2n}} + \sum_{n \geq 0}\left(\frac{1}{3}\right)^{n+1} z^n$$

.

By construction, the first term converges for $\left|\dfrac{1}{z^2}\right| < 1 \iff |z| > 1$ and the second for $|z| < 3$.

Region 3: Take the following expansion:

$$f(z) = \frac{1}{1 - z^2} + \frac{1}{3 - z}$$

$$= -\frac{1}{z^2}\left(\frac{1}{1 - \frac{1}{z^2}}\right) - \frac{1}{z}\left(\frac{1}{1 - \frac{3}{z}}\right)$$

$$= -\frac{1}{z^2}\sum_{n \geq 0}\frac{1}{z^{2n}} - \frac{1}{z}\sum_{n \geq 0} 3^n \frac{1}{z^n}$$

$$= -\sum_{n \geq 2}\frac{1}{z^{2n}} - \sum_{n \geq 1}\left(\frac{1}{3}\right)^{n-1}\frac{1}{z^n}.$$

> Note: in principle, terms could be collected here.

By construction, this converges on $\left\{|z|^2 > 1\right\}\bigcap\{|z| > 3\} = \{|z| > 3\}$.

∎

1.3 3

> Let P, Q be polynomials with no common zeros. Assume a is a root of Q. Find the principal part of P/Q at $z = a$ in terms of P and Q if a is (1) a simple root, and (2) a double root.

1.3.1 Solution

> todo

1.4 4

> Let f be non-constant, analytic in $|z| > 0$, where $f(z_n) = 0$ for infinitely many points z_n with $\lim\limits_{n \to \infty} z_n = 0$.
>
> Show that $z = 0$ is an essential singularity for f.
>
> Example: $f(z) = \sin(1/z)$.

1.4.1 Solution

It suffices to show that $z_0 = 0$ is neither a pole nor a removable singularity, i.e.

1. $\lim\limits_{z \to z_0} f(z) \neq \infty$

2. $|f(z)|$ is not bounded on any neighborhood $D_\varepsilon(z_0)$.

The first property follows because if f is analytic,

1.5 5

> Show that if f is entire and $\lim\limits_{z \to \infty} f(z) = \infty$, then f is a polynomial.

1.6 6

Problem : a. Show that

$$\int_0^{2\pi} \log \left| 1 - e^{i\theta} \right| \, d\theta = 0$$

b. Show that this identity is equivalent to SS 3.8.9.

1.7 7

> Let $0 < a < 4$ and evaluate
>
> $$\int_0^\infty \frac{x^{\alpha-1}}{1 + x^3} \, dx$$

1.8 8

> Prove the fundamental theorem of Algebra using
>   a. Rouche's Theorem.
>   b. The maximum modulus principle.

1.9 9

Let f be analytic in a region D and γ a rectifiable curve in D with interior in D.
Prove that if $f(z)$ is real for all $z \in \gamma$, the f is constant.

1.10 10

For $a > 0$, evaluate

$$\int_0^{\pi/2} \frac{d\theta}{a + \sin^2 \theta}$$

1.11 11

Find the number of roots of $p(z) = 4z^4 - 6z + 3$ in $|z| < 1$ and $1 < |z| < 2$ respectively.

1.12 12

Prove that $z^4 + 2z^3 - 2z + 10$ has exactly one root in each open quadrant.

1.12.1 Solution

Let $f(z) = z^4 + 2z^3 - 2z + 10$, and consider the following contour:

By the argument principle, we have

$$\Delta_\Gamma \arg f(z) = 2\pi(Z - P),$$

where Z is the number of zeros of f in the region Ω enclosed by Γ and P is the number of poles in Ω.

Since polynomials are holomorphic on $\mathbb{C}$, by the argument principle it suffices to show that

- f does not have any roots on the real or imaginary axes
- f does not vanish on Γ, and
- $\Delta_\Gamma \arg f(z) = 1$, where Δ_Γ denotes the total change in the argument of f over Γ.

It will follow by symmetry that f has exactly one root in each quadrant.

Claim 1.1.

- f has no roots on the coordinate axes.
- $\Delta_{\gamma_1} \arg f(z) = 0$
- $\Delta_{\gamma_2} \arg f(z) = 2\pi$
- $\Delta_{\gamma_3} \arg f(z) = 0$

Given the claim, we would have

$$\Delta_\Gamma \arg f(z) = 2\pi = 2\pi(Z - 0) \implies Z = 1,$$

which is what we wanted to show.

Proof of Claim:

γ_2: For $R \gg 0$, we have $f(z) \sim z^4$. Along γ_2, the argument of z ranges from 0 to $\dfrac{\pi}{2}$, and thus the argument of z^4 ranges from 0 to $4 \cdot \dfrac{\pi}{2} = 2\pi$.

γ_1: By cases, for $z \in \mathbb{R}$,

- If $|z| > 1$, then $z^3 > z$ and so

$$\begin{aligned} f(z) &= (z^4 + 10) + (2z^3 - 2z) \\ &> (z^4 + 10) + (2z - 2z) \\ &= z^4 + 10 \\ &> 0, \end{aligned}$$

  so f is strictly positive and does not change argument on $(\pm 1, \pm \infty)$ or $i \cdot (\pm 1, \pm \infty)$.

- If $|z| \le 1$,

$$\begin{aligned} \left| -z^4 - 2z^3 + 2z \right| &\le |z|^4 + 2|z|^3 + 2|z| \\ &\le 1 + 2 + 2 \\ &= 5 \\ &< 10 \\ \implies f(z) = 10 - (-z^4 - 2z^3 + 2z) &> 0, \end{aligned}$$

  so f is strictly positive and does not change argument $(0, \pm 1)$ or $i \cdot (0, \pm 1)$.

∎

1.13 13

> Prove that for $a > 0$, $z \tan z - a$ has only real roots.

1.14 14

> Let f be nonzero, analytic on a bounded region Ω and continuous on its closure $\overline{\Omega}$.
> Show that if $|f(z)| \equiv M$ is constant for $z \in \partial\Omega$, then $f(z) \equiv Me^{i\theta}$ for some real constant θ.

1.14.1 Solution

2 Stein and Shakarchi

2.1 S&S 3.8.1

Using Euler's formula

$$\sin(\pi z) = \frac{1}{2i}(e^{i\pi z} - e^{-i\pi z})$$

show that the complex zeros of $\sin(\pi z)$ are exactly the integers, each of order one.
Calculate the residue of $\dfrac{1}{\sin(\pi z)}$ at $z = n \in \mathbb{Z}$.

2.2 S&S 3.8.2

Evaluate the integral

$$\int_{\mathbb{R}} \frac{dx}{1 + x^4}$$

What are the poles of the integrand?

2.3 S&S 3.8.4

Show that

$$\int_{\mathbb{R}} \frac{x \sin x}{x^2 + a^2} = \frac{\pi e^{-a}}{a} \quad a > 0$$

2.4 S&S 3.8.5

Show that for $\xi \in \mathbb{R}$,

$$\int_{\mathbb{R}} \frac{e^{2\pi i x \xi}}{(1 + x^2)^2} = \frac{\pi}{2}(1 + 2\pi|\xi|)e^{-2\pi|\xi|}$$

2.5 S&S 3.8.6

Show that

$$\int_{\mathbb{R}} \frac{dx}{(1 + x^2)^{n+1}} = \frac{1 \cdot 3 \cdots (2n - 1)\pi}{2 \cdot 4 \cdots (2n}$$

2.6 S&S 3.8.7

Show that for $a > 1$,

$$\int_0^{2\pi} \frac{d\theta}{(a + \cos\theta)^2} = \frac{2\pi a}{(a^2 - 1)^{3/2}}$$

2.7 S&S 3.8.8

Show that if $a, b \in \mathbb{R}$ with $a > |b|$ then

$$\int_0^{2\pi} \frac{d\theta}{a + b\cos\theta} = \frac{2\pi a}{\sqrt{a^2 - b^2}}$$

2.8 S&S 3.8.9

Show that

$$\int_0^1 \log(\sin \pi x)\ dx = -\log 2$$

2.9 S&S 3.8.10

Show that if $a > 0$

$$\int_0^\infty \frac{\log x}{x^2 + a^2}\ dx = \frac{\pi \log a}{2a}$$

2.10 S&S 3.8.14

Prove that if f is entire and injective, then $f(z) = az + b$ with $a, b \in \mathbb{C}$ with $a \neq 0$.
    Hint: apply the Casorati-Weierstrass theorem to $f(1/z)$.

2.11 S&S 3.8.15

Use the Cauchy inequalities or the maximum modulus principle to solve the following problems:

2.11.1 a

If f is entire and for all $R > 0$, there are constants $A, B > 0$ such that $\sup_{|z|=R} |f(z)| \leq AR^k + B$,

then f is a polynomial of degree less than k.

2.11.2 b

Show that if f is holomorphic on the unit disk, is bounded, and converges to zero uniformly in the sector $\theta \leq \arg z \leq \phi$ as $|z| \longrightarrow 1$, then $f \equiv 0$.

2.11.3 c

Let $w_1, \cdots, w_n$ be points on $S^1 \subset \mathbb{C}$. Show that there exists a point $z \in S^1$ such that

$$\prod_{i=1}^{n} |z - w_i| \geq 1.$$

Conclude that there exists a point $w \in S^1$ such that

$$\prod_{i=1}^{n} |w - w_i| = 1.$$

2.11.4 d

Show that if f is entire and $\Re(f)$ is bounded, then f is constant.

2.12 S&S 3.8.17

Let f be non-constant, and holomorphic in an open set containing the open unit disc.

2.12.1 a

Show that $|z| = 1 \implies |f(z)| = 1$, then the image of f contains the unit disc.

> Hint: Show that $f(z) = w_0$ has a root for every $w_0 \in \mathbb{D}$, for which it suffices to show that $f(z) = 0$ has a root, then use the maximum modulus principle.

2.12.2 b

Show that if $|z| \geq 1 \implies |f(z)| = 1$ **and** there exists a point $z_0 \in \mathbb{D}$ such that $|f(z_0)| < 1$, then the image of f contains the unit disc.

2.13 S&S 3.8.19

Prove the maximum modulus principle for harmonic functions; i.e.,

2.13.1 a

If u is a non-constant real-valued harmonic function on Ω, then u can not attain its extrema on Ω.

2.13.2 b

Suppose Ω has compact closure $\overline{\Omega}$, then if u is harmonic on Ω and continuous on $\overline{\Omega}$, then

$$\sup_{z\in\Omega}|u(z)| \leq \sup_{z\in\overline{\Omega}-\Omega}|u(z)|$$

Hint: to prove (a), assume that u attains a local maximum at z_0, and let f be holomorphic near z_0 with $u = \Re(f)$, then show that f is not open. Part (b) is a direct consequence.
